

Up to 90% Less Cleaning

## EASTECH DIGITAL TECHNOLOGY HEAD OFFICE BANGKOK, THAILAND

Eastech Digital Technology moved into their new modern Head Office building in mid 2008. The building features full glass front windows and a water feature surrounded by Granite and Stone tiles.

During the past 12 months, maintenance issues have been noticed with the feature glass windows and granite and tiles around the water feature.

The windows were becoming stained with water run off from the roof during heavy rain and the granite and tiles surrounding the water feature were becoming heavily stained with calcium carbonate which has been increasingly difficult to remove with normal cleaning.

### Application

All windows at the front of the building were professionally cleaned and coated with EnduroShield for Glass. The coating will protect the glazed surfaces by sealing the porosity of the glass, protecting against staining, etching and the general deterioration caused by weather and pollution.

The coating will reduce maintenance costs by minimising time spent cleaning as well as extending the period between cleans. Overall, the appearance of the building will benefit, with the feature glass windows remaining cleaner for longer.

Similarly, all granite, tiles and stone were cleaned to remove calcium carbonate and dirt build up and then coated with EnduroShield for Tile & Grout. The coating will prevent calcium carbonate and dirt and grime from being further absorbed into these surfaces in future. The EnduroShield coating provides an easy to clean surface that will prevent staining and degradation of these surfaces into the future.

### The Result

The application of EnduroShield™ has resulted in a building and surrounds that is now much easier to maintain and will resist staining into the future. The product is environmentally friendly and the professional application is backed with a full 3 year warranty.
